Many common wounds can become malodorous

- Pressure ulcers
- Leg ulcers
- Diabetic foot ulcers

Malodorous wounds can have serious consequences

- Psychological problems such as depression and lack of self-esteem
- Detrimental effect on body image and quality of life
- Prevention of intimacy with partners
- Anxiety about whether others can smell the odour
- Nurses experiencing feelings of nausea

The wound may never disappear – but you can still improve patients’ quality of life.  

CliniSorb – Activate confidence

Wound odours are mainly caused by the production of volatile fatty acids by anaerobic bacteria. CliniSorb is an activated charcoal dressing designed to trap these volatile fatty acids.

CliniSorb – Advanced structure

- Contains an optimum combination of microporous activity and activated charcoal cloth weight for superior adsorption
- Reduces the danger of charcoal fibres breaking off into the wound

How CliniSorb works

The activated charcoal surface in the dressing electrostatically attracts volatile fatty acids and adsorbs them, to prevent odour escaping.

CliniSorb – Cost-effective compared to other leading brands

“CliniSorb is a versatile, cost-effective and effective charcoal dressing, and is a consideration when deciding on the management for the individual patient with a malodorous wound” – Morris 2008

CliniSorb is flexible and easy to use

- Can be used as a primary or secondary dressing
- Soft, flexible construction can be cut to fit practically any wound. Even fungating wounds on curved body sites can be easily dressed
- Can be applied either side down
- Can remain in situ for up to one week

References:

* A separate primary dressing may be needed in dry or lightly exuding wounds.
